

TITLE: LAMP SHADE FOLDING STRUCTURE

BACKGROUND OF THE INVENTION

(a) Field of the Invention

5 The present invention is related to a lamp-shape folding structure, and more particularly, to one that effectively reduces the dimension of the lamp-shade for saving transportation and packing material costs.

(b) Description of the Prior Art:

10 Whereas a shade of a lamp is provided in a shape of a cape surrounding a bulb thus to keep the light not so irritating to one's eyes. Light may be present in various effects when emitting through the shade. As the shade usually has to expand for covering a certain space large enough to properly block the light source, it contains a mounting piece to adapt to the lighting
15 fixture while the rest of the shade consumes a lot of space. Therefore, additional packing material and space are required during shipment, and higher custom clearance costs have to be paid.

For certain shades generally available in the market are made of soft and flexible materials restricted respectively at top and bottom an upper ring and a
20 lower ring so that in transition, both rings are put together on a practically same plane to reduce shipping volume. However, both rings still claim a larger shipping space to prevent further reduction to the minimum shipping volume. Particularly, said shade, generally referred to a KD shade has its support frame for expanding the main portion of the shade connected to the
25 lower ring. Therefore, when the support frame is put up side down during shipment, the support frame when lying flat must be maintained at a lateral length not greater than the diameter of the lower ring. Consequently, in the overall design of the KD shade, its diagonal length must not be greater than the diameter of the lower ring.

30

SUMMARY OF THE INVENTION

A1
The primary purpose of the present invention is to provide a lampshade having its upper and lower rings designed to allow both rings ^{to be pivoted} in conjunction with a support frame provided in between the upper and lower rings, to stretch out the main portion of the shade ^{which} made of soft and flexible material. Accordingly, upon disassembling the lamp shade, the support frame can be removed to place both rings on the same plane to reduce the height of the lamp shade while both rings are folded into a semi-circular shape, thus to achieve the minimum shipping space required and reduce the packing and shipping costs.

Another purpose of the present invention is to provide a lampshade that permits it to be knocked down to its most compact dimension to facilitate carrying and storage.

Another purpose yet of the present invention is to provide a lampshade that when the shade is not in use, its support frame can be removed so to eliminate the restriction on the overall dimension as the prior art of the present invention has been subject to.

BRIEF DESCRIPTION OF THE DRAWINGS

Fig. 1 is a view showing the appearance of a preferred embodiment of the present invention.

Fig. 2 is a schematic view showing an assembly of the preferred embodiment of the present invention.

Fig. 3 is a view showing that the preferred embodiment of the present invention is folded in.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

Referring to Fig. 1, a preferred embodiment of the present invention is essentially comprised of a soft shade (1) respectively fixed to its top and bottom an upper ring (2) and a lower ring (3), and a support frame (4)

provided between said upper ring (2) and lower ring (3) to stretch the shade into a conic cape shape. A mounting hub (21) is provided at the center of the upper ring (1) to connect the shade (1) to a lighting fixture, and multiple links (22) are provided in radiation to connect between the hub (21) and the outer circumference of the upper ring (1) to give better structural strength.

As illustrated in Fig. 2, the support frame (4) is comprised of bent, flexible rods with its top forming a lateral section (42) to hold against the upper ring (1), then bent from both ends of said lateral section (42) downwards to form two straight sections (41) to push against the lower ring (2). A first stopper (33) and a second stopper (411) are respectively formed on the circumference (31) of the lower ring (3) and at both lower ends of the straight sections (41). In the preferred embodiment of the present invention, the second stopper (411) is directly formed by having the end of the straight section laterally bent for a proper length while the first stopper (33) is formed as a loop. Upon assembling, the second stopper (411) from the straight section (41) is directly inserted through the first stopper (33) of the lower ring (3) for the first stopper (33) to hold the second stopper (411) of the straight section (41) in position, and for the straight section (41) to actually stretch up the soft shade (1) by taking advantage of flexibility of the straight section (41).

Furthermore, the top of the support frame (4) can hold against each other with the links (22) mutually corresponding to the lateral section (42) and the upper ring (2). Within, the outwardly expanding support frame (4) works together with the pull force from the soft shade (1) to form a consistent binding force among the support frame (4), the upper ring (2) and the lower ring (3). When the shade is not used, simply bend the straight section (41) of the support frame (4) a little bit to disengage both of said first and second stoppers (33) (411) from each other, thus to remove the support frame (4) from the upper and the lower rings (2), (3), in turn, both rings (2) (3) are put together on the same plane by taking advantage of the softness of the shade (1) to reduce the height of the lampshade.

Now referring to Fig. 3, two pivoting devices (32) are provided on the circumference (31) at both extremes of any diameter of the lower ring (3) so to be folded into a semi-circular shape when the lampshade is not used or packed for shipment for further reduction of packing and transportation costs.

5 If required, the similar pivoting devices can be also provided to the upper ring (1). Since the support frame (4) can be removed, it is not necessary to consider whether the length of the support frame (4) is greater than the width of the lower ring (3) as in the case of the design of the prior art of a KD lampshade.

10 As disclosed above, the present invention provides an improved structure to reduce packing and transportation costs for a lampshade by providing pivoting devices to both or either of the upper and lower rings so that either or both rings can be folded into semi-circular shape; and a support frame that can be removed from both rings to reduce the height of the
15 lampshade. Therefore, this application for utility patent is duly filed accordingly.
